Concentration: 1 mg/ml

**Storage Stability:** -15°C to -25°C/1 year(Do not lower than -25°C)

Observed Band: 90kD

**Cell Pathway:** PI3K/Akt; Protein\_Acetylation

**Background:** This gene encodes a member of the heat shock protein 90 family; these proteins

are involved in signal transduction, protein folding and degradation and

morphological evolution. This gene encodes the constitutive form of the cytosolic 90 kDa heat-shock protein and is thought to play a role in gastric apoptosis and

inflammation. Alternative splicing results in multiple transcript variants. Pseudogenes have been identified on multiple chromosomes. [provided by

RefSeq, Dec 2012],

**Function:** function:Molecular chaperone. Has ATPase activity.,PTM:Phosphorylated upon

DNA damage, probably by ATM or ATR., similarity: Belongs to the heat shock protein 90 family., subcellular location: Identified by mass spectrometry in

melanosome fractions from stage I to stage IV., subunit: Homodimer. Interacts with TP53/p53 (By similarity). Interacts with UNC45A. Binding to UNC45A involves 2

UNC45A monomers per HSP90AB1 dimer.,

Subcellular Cytoplasm . Melanosome . Nucleus . Secreted . Cell membrane . Dynein

axonemal particle. Cell surface. Identified by mass spectrometry in melanosome fractions from stage I to stage IV (PubMed:17081065). Translocates with BIRC2 from the nucleus to the cytoplasm during differentiation (PubMed:18239673).

Secreted when associated with TGFB1 processed form (LAP)
