

ATM (Phospho Ser1987) rabbit pAb

Catalog No: YP1604

Reactivity: Human; Mouse; Rat

Applications: WB;ELISA

Target: ATM

Gene Name: ATM

Protein Name: ATM (Phospho Ser1987)

Human Gene ld: 472

Human Swiss Prot

No:

Mouse Gene Id: 11920

Mouse Swiss Prot

No:

Immunogen: Synthesized peptide derived from human ATM (Phospho Ser1987)

Specificity: This antibody detects endogenous levels of Human, Mouse, Rat ATM (Phospho

Ser1987)

Q62388

Q62388(Q13315)

Formulation : Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.

Source: Polyclonal, Rabbit, IgG

Dilution: WB 1:1000-2000 ELISA 1:5000-20000

Purification: The antibody was affinity-purified from rabbit serum by affinity-chromatography

using specific immunogen.

Concentration: 1 mg/ml

Storage Stability: -15°C to -25°C/1 year(Do not lower than -25°C)

1/2

Observed Band: 350kD

Background: The protein encoded by this gene belongs to the PI3/PI4-kinase family. This

protein is an important cell cycle checkpoint kinase that phosphorylates; thus, it functions as a regulator of a wide variety of downstream proteins, including tumor suppressor proteins p53 and BRCA1, checkpoint kinase CHK2, checkpoint proteins RAD17 and RAD9, and DNA repair protein NBS1. This protein and the closely related kinase ATR are thought to be master controllers of cell cycle checkpoint signaling pathways that are required for cell response to DNA damage and for genome stability. Mutations in this gene are associated with ataxia

telangiectasia, an autosomal recessive disorder. [provided by RefSeq, Aug 2010],

Function: catalytic activity:ATP + a protein = ADP + a phosphoprotein.,disease:Defects in

ATM are the cause of ataxia telangiectasia (AT) [MIM:208900]; also known as Louis-Bar syndrome, which includes four complementation groups: A, C, D and E. This rare recessive disorder is characterized by progressive cerebellar ataxia, dilation of the blood vessels in the conjunctiva and eyeballs, immunodeficiency,

growth retardation and sexual immaturity. AT patients have a strong

predisposition to cancer; about 30% of patients develop tumors, particularly lymphomas and leukemias. Cells from affected individuals are highly sensitive to damage by ionizing radiation and resistant to inhibition of DNA synthesis following irradiation., disease: Defects in ATM contribute to B-cell chronic lymphocytic

leukemia (BCLL). BCLL is the commonest form of leukemia in the elderly. It is

characterized by the accumulation of ma
