Background :	The protein encoded by this gene is erythrocyte-specific and is thought to be part of a membrane channel that transports ammonium and carbon dioxide across the blood cell membrane. The encoded protein appears to interact with Rh blood group antigens and Rh30 polypeptides. Defects in this gene are a cause of regulator type Rh-null hemolytic anemia (RHN), or Rh-deficiency syndrome.[provided by RefSeq, Mar 2009],
Function :	disease:Defects in RHAG are the cause of regulator type Rh-null hemolytic anemia (RHN) [MIM:268150]; also called Rh-deficiency syndrome. RHN is a form of chronic hemolytic anemia in which the red blood cells have a stomatocytosis and spherocytosis morphology, an increased osmotic fragility, an altered ion transport system, and abnormal membrane phospholipid organization.,function:Associated with rhesus blood group antigen expression. May be part of an oligomeric complex which is likely to have a transport or channel function in the erythrocyte membrane.,similarity:Belongs to the ammonium transporter (TC 2.A.49) family. Rh subfamily.,subunit:Heterotetramer.,tissue specificity:Erythrocytes.,
Subcellular Location :	Membrane ; Multi-pass membrane protein.
Expression :	Erythrocytes.
