**Observed Band :** 38kD

**Cell Pathway :** Cell adhesion molecules (CAMs);

**Background :** This gene encodes a glycoprotein expressed on the surface of NK cells, platelets, monocytes and a subset of T cells. It is a member of the Ig-superfamily containing 2 Ig-like domains of the V-set. The protein mediates cellular adhesion of platelets and megakaryocytic cells to vascular endothelial cells. The protein also plays a role in megakaryocytic cell maturation. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Jan 2015],

**Subcellular Location :** Cell membrane ; Single-pass type I membrane protein .

**Expression :** Expressed by peripheral blood T-lymphocytes.
