Background: The protein encoded by this gene is a member of the interleukin 1 cytokine

family. This gene and eight other interleukin 1 family genes form a cytokine gene cluster on chromosome 2. This cytokine is thought to participate in a network of interleukin 1 family members to regulate adapted and innate immune responses. Two alternatively spliced transcript variants encoding the same protein have been

reported. [provided by RefSeq, Jul 2008],

Function: function:Binds soluble IL-1 receptor type 1.,online information:Interleukin-1

entry, similarity: Belongs to the IL-1 family., tissue specificity: Expressed in fetal skin, spleen and tonsil. Expressed mostly in the basal epithelia of skin and in

proliferating B-cells of the tonsil.,

Subcellular Location : Cytoplasm . Secreted . The secretion is dependent on protein unfolding and facilitated by the cargo receptor TMED10; it results in protein translocation from the cytoplasm into the ERGIC (endoplasmic reticulum-Golgi intermediate

compartment) followed by vesicle entry and secretion. .

Expression: Expressed in fetal skin, spleen and tonsil. Expressed mostly in the basal

epithelia of skin and in proliferating B-cells of the tonsil.
