Background: dynamin 1(DNM1) Homo sapiens This gene encodes a member of the dynamin

> subfamily of GTP-binding proteins. The encoded protein possesses unique mechanochemical properties used to tubulate and sever membranes, and is involved in clathrin-mediated endocytosis and other vesicular trafficking processes. Actin and other cytoskeletal proteins act as binding partners for the encoded protein, which can also self-assemble leading to stimulation of GTPase activity. More than sixty highly conserved copies of the 3' region of this gene are found elsewhere in the genome, particularly on chromosomes Y and 15. Alternatively spliced transcript variants encoding different isoforms have been

described. [provided by RefSeq, Jul 2008],

catalytic activity:GTP + H(2)O = GDP + phosphate.,function:Microtubule-**Function:**

trafficking processes, in particular endocytosis., similarity: Belongs to the dynamin

family., similarity: Contains 1 GED domain., similarity: Contains 1 PH
