depression; Progesterone-mediated oocyte maturation; Pathways in cancer; Colorectal cancer; Glioma; Prostate cancer; Melanoma;

Background: This receptor binds insulin-like growth factor with a high affinity. It has tyrosine

kinase activity. The insulin-like growth factor I receptor plays a critical role in transformation events. Cleavage of the precursor generates alpha and beta subunits. It is highly overexpressed in most malignant tissues where it functions as an anti-apoptotic agent by enhancing cell survival. Alternatively spliced transcript variants encoding distinct isoforms have been found for this gene.

Function: catalytic activity:ATP + a [protein]-L-tyrosine = ADP + a [protein]-L-tyrosine

phosphate., disease: Defects in IGF1R may be a cause in some cases of resistance to insulin-like growth factor 1 (IGF1 resistance) [MIM:270450]. IGF1 resistance is a gowth deficiency disorder characterized by intrauterine growth retardation and poor postnatal growth accompanied with increased plasma

activity., function: This receptor binds insulin-like growth factor 1 (IGF1) with a high affinity and IGF2 with a lower affinity. It has a tyrosine-protein kinase activity, which is necessary for the activation of the IGF1-stimulated downstream signaling

cascade. When present in a hybrid receptor with INSR, binds IGF1.

Expression: Found as a hybrid receptor with INSR in muscle, heart, kidney, adipose tissue,

skeletal muscle, hepatoma, fibroblasts, spleen and placenta (at protein level).

Expressed in a variety of tissues. Overexpressed in tumors, including melanomas, cancers of the colon, pancreas prostate and kidney.
