Background : The protein encoded by this gene contains a THAP domain, which is a conserved DNA-binding domain that has striking similarity to the site-specific DNA-binding domain (DBD) of Drosophila P element transposases. [provided by RefSeq, Jul 2008],

Function : function:Transcriptional repressor that plays a central role for embryogenesis and the pluripotency of embryonic stem (ES) cells. Sequence-specific DNA-binding factor that represses gene expression in pluripotent ES cells by directly binding to key genetic loci and recruiting epigenetic modifiers.,polymorphism:The length of the poly-Gln region is variable in the population.,similarity:Belongs to the THAP11 family.,similarity:Contains 1 THAP-type zinc finger.,subcellular location:May be regulated by shuttling of the protein between the cytoplasm and nucleus.,subunit:Interacts (via coiled coil domain) with HCFC1.,

Subcellular Location : Nucleus . Cytoplasm . May be regulated by shuttling of the protein between the cytoplasm and nucleus. .

Expression : Brain,Neuroblastoma,Uterus,
