

CD8a-FC recombinant protein

YD3059 Catalog No:

Reactivity: Human;

>90% as determined by SDS-PAGE **Purity:**

Gene Name: CD8A

Protein Name: T-cell surface glycoprotein CD8 alpha chain (T-lymphocyte differentiation

antigen T8/Leu-2) (CD antigen CD8a)

Amino acid:22-182, with FC tag. Sequence:

P01732

Human Gene Id: 925

Human Swiss Prot

Formulation:

No:

Phosphate-buffered solution

Source: Mammalian cells

-15°C to -25°C/1 year(Avoid freeze / thaw cycles) **Storage Stability:**

Function: Integral membrane glycoprotein that plays an essential role in the immune

> response and serves multiple functions in responses against both external and internal offenses. In T-cells, functions primarily as a coreceptor for MHC class I molecule:peptide complex. The antigens presented by class I peptides are derived from cytosolic proteins while class II derived from extracellular proteins. Interacts simultaneously with the T-cell receptor (TCR) and the MHC class I proteins presented by antigen presenting cells (APCs). In turn, recruits the Src kinase LCK to the vicinity of the TCR-CD3 complex. LCK then initiates different intracellular signaling pathways by phosphorylating various substrates ultimately leading to lymphokine production, motility, adhesion and activation of cytotoxic Tlymphocytes (CTLs). This mechanism enables CTLs to recognize and eliminate

infected cells and tumor cells.

Subcellular Location:

[Isoform 1]: Cell membrane; Single-pass type I membrane protein. Note=CD8A localizes to lipid rafts only when associated with its partner CD8B. .; [Isoform 2]:

Secreted.

Expression:

CD8 on thymus-derived T-cells usually consists of a disulfide-linked alpha/CD8A and a beta/CD8B chain. Less frequently, CD8 can be expressed as a CD8A homodimer. A subset of natural killer cells, memory T-cells, intraepithelial lymphocytes, monocytes and dendritic cells expresses CD8A homodimers. Expressed at the cell surface of plasmacytoid dendritic cells upon herpes simplex virus-1 stimulation.
