

Integrin β3 (PTR2555) Mouse mAb

Catalog No: YM4695

Reactivity: Human (predicted: Mouse; Rat)

Applications: WB;ELISA

Target: Integrin β3

Fields: >>Rap1 signaling pathway;>>Phagosome;>>Pl3K-Akt signaling

pathway;>>Osteoclast differentiation;>>Focal adhesion;>>ECM-receptor

interaction;>>Platelet activation;>>Neutrophil extracellular trap formation;>>Hematopoietic cell lineage;>>Regulation of actin

cytoskeleton;>>Thyroid hormone signaling pathway;>>Human cytomegalovirus

infection;>>Human papillomavirus infection;>>Herpes simplex virus 1

infection;>>Proteoglycans in cancer;>>MicroRNAs in cancer;>>Hypertrophic cardiomyopathy;>>Arrhythmogenic right ventricular cardiomyopathy;>>Dilated

cardiomyopathy;>>Fluid shear stress and atherosclerosis

Gene Name: ITGB3 GP3A

Protein Name: Integrin beta-3 (Platelet membrane glycoprotein IIIa) (GPIIIa) (CD antigen

CD61)

Human Gene Id: 3690

Human Swiss Prot P05106

No:

Mouse Gene Id: 16416

Mouse Swiss Prot

No:

O54890

Immunogen : Synthesized peptide derived from human Integrin β3 AA range: 700-788

Specificity: This antibody detects endogenous levels of Integrin β3 at Human, Mouse, Rat

Formulation: PBS, pH7.4, 50% glycerol, 0.03%Proclin 300

Source: Mouse,monoclonal:lgG1,Lambda

1/3

WB 1:500-2000, ELISA 1:5000-20000 **Dilution:**

Purification: Protein G

-15°C to -25°C/1 year(Do not lower than -25°C) **Storage Stability:**

Observed Band: 87kDa

integrin subunit beta 3(ITGB3) Homo sapiens The ITGB3 protein product is the **Background:**

integrin beta chain beta 3. Integrins are integral cell-surface proteins composed of an alpha chain and a beta chain. A given chain may combine with multiple partners resulting in different integrins. Integrin beta 3 is found along with the alpha IIb chain in platelets. Integrins are known to participate in cell adhesion as

well as cell-surface mediated signalling. [provided by RefSeq, Jul 2008],

Function: disease:Defects in ITGB3 are a cause of Glanzmann thrombasthenia (GT)

> [MIM:273800]; also known as thrombasthenia of Glanzmann and Naegeli. GT is the most common inherited disease of platelets. Its inheritance is autosomal recessive. It is characterized by mucocutaneous bleeding of mild-to-moderate severity and the inability of this integrin to recognize macromolecular or synthetic peptide ligands. GT has been classified clinically into types I and II. In type I. platelets show absence of the glycoprotein IIb-IIIa complexes at their surface and lack fibringen and clot retraction capability. In type II, the platelets express the GPIIb-IIIa complex at reduced levels (5-20% controls), have detectable amounts of fibrinogen, and have low or moderate clot retraction capability. The platelets of

receptors.,function:Int

Cell membrane; Single-pass type I membrane protein. Cell projection, Subcellular Location:

lamellipodium membrane. Cell junction, focal adhesion. Cell junction, synapse,

GT variants have normal or near normal (60-100%) expression of dysfunctional

postsynaptic cell membrane; Single-pass type I membrane protein. Cell junction,

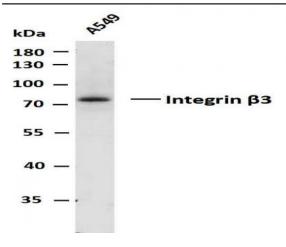

synapse.

Isoform beta-3A and isoform beta-3C are widely expressed. Isoform beta-3A is **Expression:**

specifically expressed in osteoblast cells; isoform beta-3C is specifically

expressed in prostate and testis.

Products Images

Whole cell lysates of A549 were separated by 10% SDS-PAGE, and the membrane was blotted with anti-Integrin $\beta3(PTR2555)$ antibody. The HRP-conjugated Goat anti-Mouse IgG(H + L) antibody was used to detect the antibody. Lane 1: A549 Predicted band size: 87kDa Observed band size: 72kDa
